

EXERCISE 2

Create an ABAP Package

ABAP Development Tools (ADT) • ABAP Cloud

COURSE VALUES

Group number: 9309

Package: ZS4D400_9309

Description: My ABAP Package

Superpackage: ZSTUDENTS

Software Component: ZSTUDENTS

Transport request used in my exercise: L02K910107

CONFIDENTIALITY

This document intentionally does not contain service URLs, passwords, browser login details, or other access credentials. Keep training-system access information private.

1. Exercise Objective

The purpose of this exercise is to create my own ABAP development package. This package becomes the home for the ABAP classes and other development objects you create during the course.

What problem are we solving?

ABAP development objects need to be organized inside packages. A package is similar to a project folder for ABAP repository objects. Instead of creating classes randomly in the system, you create my own package under the course-provided superpackage and keep my exercises together.

2. Required Package Configuration

Attribute	Value
Package Name	ZS4D400_9309
Description	My ABAP Package
Add to Favorite Packages	Checked
Superpackage	ZSTUDENTS
Software Component	ZSTUDENTS
Transport Request	L02K910107

3. Task 1 — Add /LRN/S4D400_EXERCISE to Favorites

This package contains SAP-provided training material. Adding it to Favorite Packages makes it easier to find during the course.

- In Eclipse, open the Project Explorer.
- Expand my ABAP Cloud project.
- Locate Favorite Packages.

CONFIDENTIAL TRAINING DOCUMENT — Access credentials and service connection details are not included.

- Right-click Favorite Packages.
- Choose Add Package...
- In the search field, enter /LRN/S4D400.
- Select /LRN/S4D400_EXERCISE from the results.
- Choose OK.

Why Favorites?

Favorite Packages do not create a new package. They are simply a convenient list of packages you use frequently.

4. Task 2 — Create My Own ABAP Package

Follow these steps exactly.

- 1. Open the package creation wizard.** In Project Explorer, right-click my ABAP Cloud project → New → ABAP Package.
- 2. Enter the package name.** Enter ZS4D400_9309 in the Name field.
- 3. Enter the description.** Enter My ABAP Package.
- 4. Add to favorites.** Tick Add to favorite packages.
- 5. Set the superpackage.** Enter ZSTUDENTS in the Superpackage field.
- 6. Continue.** Choose Next.
- 7. Check the software component.** Make sure Software Component is ZSTUDENTS.
- 8. Continue.** Choose Next.
- 9. Select my transport request.** Choose Choose from requests in which I am involved and select L02K910107.
- 10. Finish.** Choose Finish and wait for Eclipse to create the package.

5. What My Package Structure Means

```

ZSTUDENTS
|
+-- ZS4D400_9309
    |
    +-- My ABAP Classes
    +-- My Interfaces
    +-- My Other Development Objects
  
```

Think of ZSTUDENTS as the course-level container and ZS4D400_9309 as my personal workspace inside that container.

6. Important Technical Terms

Term	Simple meaning
ABAP Package	A container used to organize ABAP development objects.
Superpackage	A higher-level package that contains subpackages.
Development Object	An ABAP repository object such as a class, interface, table, or data definition.
Favorite Package	A shortcut/list entry that makes a package easier to access in Project Explorer.
Software Component	A larger software unit to which development objects/packages belong.
Transport Request	A container used to record development changes so they can be transported between systems.
Project Explorer	Eclipse view showing the ABAP project and its package/object hierarchy.
Repository	SAP's central storage and management area for development objects.

7. Why Packages Matter in a Real Company

A package is not just a folder. It is part of how SAP controls, organizes, transports, and manages development objects.

- Organization: developers can identify which application or project an object belongs to.
- Ownership and responsibility: packages help separate development areas and teams.
- Transport management: development objects are associated with transport mechanisms so changes can move through system landscapes.
- Access and structure: package properties and relationships help control how objects are organized and consumed.
- Maintainability: a large SAP system can contain thousands of objects; without structure, finding the correct object becomes difficult.

Company interview point

If an interviewer asks 'Why do we use packages in ABAP?', do not answer only 'to store classes'. A better answer is: Packages organize repository objects into logical development units and are important for software organization and transport management.

8. What You Performed

- Added the SAP training package /LRN/S4D400_EXERCISE to Favorite Packages.
- Created my personal course package ZS4D400_9309.
- Set its description to My ABAP Package.
- Placed it under the superpackage ZSTUDENTS.
- Associated it with the ZSTUDENTS software component.
- Assigned the package creation to my existing transport request.
- Added my own package to Favorite Packages.

9. Why the Transport Request Was Needed

In the SAP development environment, changes are normally recorded in transport requests. A transport request groups changes made by a developer so they can be managed and moved through the system landscape.

For my exercise, the transport request used was L02K910107. Treat transport numbers as development-system metadata; they are not passwords, but they should still not be mixed with or published alongside access credentials.

10. Verification Checklist

- ☐ /LRN/S4D400_EXERCISE appears under Favorite Packages.
- ☐ ZS4D400_9309 exists.
- ☐ Description is My ABAP Package.
- ☐ Superpackage is ZSTUDENTS.
- ☐ Software Component is ZSTUDENTS.
- ☐ ZS4D400_9309 appears under Favorite Packages.
- ☐ My package is ready for the next exercise.

11. Interview Questions & Answers

1. What is an ABAP package?

An ABAP package is a logical container for development objects such as classes, interfaces, and other repository objects.

2. What is a superpackage?

A superpackage is a higher-level package that contains other packages. In this exercise, ZSTUDENTS is the superpackage.

3. What is the difference between a package and a Favorite Package?

A package is a real repository object. A Favorite Package is only a convenient entry in Project Explorer.

4. Why did we create ZS4D400_9309?

It provides a dedicated development area for my course exercises so my objects are organized under my own package.

5. Why is the package name ZS4D400_9309?

ZS4D400 identifies the course/package naming convention, and 9309 is assigned group number.

6. What is a transport request?

It records related development changes so SAP can manage and transport those changes between systems.

7. Why should a developer use the existing transport request when instructed?

Because the course or project may already have a transport assigned for my development work. Using the correct request keeps changes organized.

8. What is a software component?

It represents a larger software unit in the SAP system to which development content belongs. Here it is ZSTUDENTS.

9. Can I create a class outside my package?

Technically it may be possible depending on system permissions, but you should create project objects in the package assigned to development task.

10. Why is package organization important in a company?

Because enterprise SAP systems contain huge numbers of objects. Logical packages make development, ownership, maintenance, and transport management easier.

12. Exercise 2 — Final Understanding

In one sentence

We created ZS4D400_9309 as our personal ABAP development package under ZSTUDENTS so that all course development objects can be organized and managed correctly.

The next exercises build directly on this package. For example, my Hello World class ZCL_9309_HELLO_WORLD and later classes such as ZCL_9309_COMPUTE, ZCL_9309_BRANCH, and ZCL_9309_ITERATE are created inside this package.
