

EXERCISE 1

Create an ABAP Cloud Project and Investigate ABAP Coding

ABAP Development Tools (ADT) • ABAP Cloud

CONFIDENTIALITY

This document uses screenshots supplied during the exercise. Connection URLs, user IDs, project/access identifiers and other access-related information have been redacted from the screenshots included here. Do not distribute the original unredacted screenshots.

Purpose

This exercise is not mainly about writing ABAP code. It is designed to make you comfortable with the Eclipse + ABAP Development Tools environment: creating an ABAP Cloud project, finding development objects, inspecting metadata, searching code, navigating to implementations, viewing object information, and opening ABAP Language Help.

What you should be able to do after Exercise 1

- Create and open an ABAP Cloud Project in Eclipse.
- Add an SAP package to Favorite Packages.
- Open an ABAP class directly using its development-object name.
- Use the Properties view to inspect administrative information.
- Use Link with Editor to locate the current object in Project Explorer.
- Search source code with Ctrl + F.
- Use F3 to navigate to a declaration/implementation.
- Use F2 to display information about a code element without leaving the editor.
- Use F1 to open ABAP Language Help for a keyword.

Task 1 — Create an ABAP Cloud Project

Goal: connect Eclipse/ADT to the ABAP Cloud system provided for the course and create the project that you will use for the remaining exercises.

Solution — Step by step

- 1. Open Eclipse.** Start Eclipse and make sure the ABAP perspective is available.
- 2. Switch to the ABAP perspective.** Choose Window → Perspective → Open Perspective → Other... → double-click ABAP.
- 3. Create the project.** Choose File → New → ABAP Cloud Project.

4. **Enter the service instance information.** Use the Service Instance URL supplied by your instructor/course. Do not copy or share the URL or credentials publicly.
5. **Log on.** Choose Open Logon Page in Browser and authenticate with the training account supplied by the instructor.
6. **Return to Eclipse.** After the browser reports a successful logon, close the browser window and return to Eclipse.
7. **Finish.** Choose Finish to create the ABAP Cloud Project.

Figure 1 — ABAP Cloud Project logon dialog. No connection URL or credentials are shown.

ABAP Service Instance Connection

Specify the project settings for the new project.

Service Instance URL: ACCESS DETAILS REDACTED

User: ACCESS DETAILS REDACTED

User ID: ACCESS DETAILS REDACTED

SAP System ID: ACCESS DETAILS REDACTED

Client: 100

Language: * EN

Project Name: PROJECT NAME REDACTED

Working Sets

☐ Add project to working sets

Working sets: [dropdown]

New... Select...

< Back Next > Finish Cancel

Figure 2 — ABAP Cloud Project connection screen. Access-related fields have been redacted.

Important security rule

A Service Instance URL is not something you should paste into public posts, GitHub repositories, screenshots, or chat messages. Treat connection details and user identifiers as private training-system information.

Task 2 — Analyze ABAP Class /DMO/CL_FLIGHT_LEGACY

The purpose is navigation and investigation. You do not need to understand the entire legacy class. The important skill is learning how to inspect an existing ABAP object efficiently.

2.1 Add /DMO/FLIGHT to Favorite Packages

- In Project Explorer, locate Favorite Packages.
- Right-click Favorite Packages → Add Package...
- Search for /DMO/FLIGHT.
- Select /DMO/FLIGHT and choose OK.

2.2 Open /DMO/CL_FLIGHT_LEGACY

- Choose Navigate → Open ABAP Development Object... or press Ctrl + Shift + A.
- Enter /DMO/CL_FLIGHT in the search field.
- Select /DMO/CL_FLIGHT_LEGACY (Class) and choose OK.

2.3 Inspect Properties

Place the cursor inside the class source code and select the Properties tab below the editor. This view contains administrative information such as package, version/status, description, responsible party, original language/system, and change information.

Figure 3 — /DMO/CL_FLIGHT_LEGACY with the Properties view. User/access identifiers are redacted.

2.4 Locate the class in Project Explorer

Use the Link with Editor button in Project Explorer. When enabled, ADT highlights the development object currently open in the editor, making it easier to find the class inside the package hierarchy.

2.5 Search for get_instance()->get

Place the cursor in the source code and press Ctrl + F. Enter exactly:

```
get_instance( )->get
```

The exercise specifically requires one blank between the brackets: get_instance() and then ->.

2.6 Navigate to the implementation of get

Place the cursor on get and press F3. Alternatively, hold Ctrl and click get, then choose Navigate to Implementation.

What does F3 mean in ABAP Development Tools?

F3 is a navigation shortcut. When the cursor is on a method, class, data object, type, or other code element, F3 tries to take you to where that element is defined/implemented. In this exercise, F3 takes you from the call of get to the implementation of get.

2.7 Inspect /dmo/travel without leaving the editor

Find the SELECT statement and place the cursor on /dmo/travel after FROM. Press F2. ADT opens contextual information about the referenced data object, such as its fields, keys, types, and descriptions.

Figure 4 — F2 contextual information for /dmo/travel. Access-related information is redacted.

2.8 Open ABAP Language Help for SELECT

Place the cursor on `SELECT` and press F1. ADT opens the ABAP Language Help for the keyword. If the initial help result is not suitable for the current ABAP language version, search for `SELECT` inside the ABAP Language Help view and press Enter.

Figure 5 — SELECT in the editor with ABAP Language Help open. Access-related information is redacted.

Technical Vocabulary — Understand These Terms

Term	Simple meaning
ABAP Cloud Project	An Eclipse project configured to develop ABAP applications on an ABAP Cloud system.
ADT	ABAP Development Tools — SAP's Eclipse-based development tools for ABAP.
Development Object	An object managed by the ABAP repository, such as a class, interface, table, or package.
Package	A container used to organize related ABAP development objects.
Class	An object-oriented blueprint containing data and methods.
Method	A procedure/function belonging to a class.
Implementation	The actual code that performs a method's behavior.
Properties	Administrative/metadata information about the selected development object.
Project Explorer	The Eclipse view that shows the project/package/object hierarchy.
Link with Editor	Keeps Project Explorer synchronized with the object currently open in the editor.
F3	Navigate to the definition/implementation of the code element under the cursor.
F2	Show contextual information about the code element under the cursor without navigating away.
F1	Open documentation/help for the selected ABAP keyword or code element.
SELECT	ABAP SQL statement used to read data from database entities.
/DMO/FLIGHT	SAP training package containing the Flight

	Reference Scenario objects.
/DMO/CL_FLIGHT_LEGACY	A training example class containing legacy-style flight/travel business logic.
/dmo/travel	A training database table/data object used by the Flight Reference Scenario.

What You Actually Performed

- Connected Eclipse ADT to an ABAP Cloud training system.
- Created the Eclipse project used for ABAP development.
- Added an SAP training package to your favorites so its objects are easy to access.
- Opened an existing global ABAP class rather than creating new code.
- Inspected class metadata through Properties.
- Used source-code search to locate a specific method call.
- Navigated from a method call to its implementation with F3.
- Inspected a database object referenced by SELECT using F2.
- Opened official ABAP syntax documentation for SELECT using F1.

Why This Exercise Matters in a Real ABAP Job

Companies rarely give a developer a completely empty system. You will normally work in a large existing codebase. The practical skill is not memorizing every class; it is being able to locate an object, understand where a method is implemented, inspect the data object being used, and find the correct SAP documentation quickly.

- Bug fixing: search for the failing method/table, inspect its implementation, and trace the flow.
- Enhancement work: identify the correct class or method before changing anything.
- Code review: inspect object metadata and navigate between definitions and implementations.
- Database work: inspect the table/data object behind a SELECT before changing the query.
- Learning unfamiliar SAP code: use F3, F2, and F1 instead of guessing.
- Cloud development: ADT and released APIs are central to modern ABAP Cloud development.

Interview Questions You Should Be Able to Answer

What is ADT?

ABAP Development Tools, the Eclipse-based toolset used to develop and maintain ABAP applications.

Why do ABAP developers use Eclipse?

Modern ABAP development, especially ABAP Cloud, is performed through ADT in Eclipse.

What is a development object?

A repository object such as a class, interface, package, table, or data definition.

What does F3 do in ADT?

It navigates from the selected code element to its definition or implementation.

What does F2 do?

It displays contextual information about the selected code element without requiring you to navigate away.

What does F1 do?

It opens ABAP Language Help/documentation for the selected keyword or code element.

Why use Link with Editor?

It synchronizes the editor selection with Project Explorer so you can locate the current object in the package hierarchy.

Why inspect Properties?

To see administrative and metadata information such as package, status/version, description, language, and change information.

What is /DMO/FLIGHT?

A SAP training package used for the Flight Reference Scenario.

Why is code navigation important in a company?

Because production systems contain large codebases; developers must trace existing logic efficiently instead of guessing.

Quick Shortcut Cheat Sheet

Shortcut / Action	Purpose
Ctrl + Shift + A	Open ABAP Development Object
Ctrl + F	Find/search within source code
F3	Navigate to definition/implementation
F2	Show contextual information
F1	Open ABAP Language Help
Link with Editor	Locate current object in Project Explorer

End result

You have completed Exercise 1 when you can create/open the ABAP Cloud project and independently use Project Explorer, Properties, search, F3, F2, and F1 to investigate /DMO/CL_FLIGHT_LEGACY.
